

**AN HYPERVALUATION OF A RING ONTO A TOTALLY ORDERED
NON-CANCELLATIVE SEMIGROUP WITHOUT ZERO DIVISORS**

ABSTRACT. In this paper we answer to a question posed by Marc KRANSER: It is possible to have a totally ordered noncancellative semigroup without zero divisors, and a ring hypervaluated by this semigroup? We were able to give a positive answer and provide an example.

KEY WORDS AND PHRASES. Hypervaluation, Valuation, Totally ordered semigroup, Ring
1980 AMS SUBJECT CLASSIFICATION CODE: 16A34 or 16A45.

1. PRELIMINARIES

In what follows, all semigroups are supposed to have a unit element 1 and a zero (absorbent) element 0 , such that $a \cdot 0 = 0 \cdot a = 0$ for all elements a in the semigroup. In any semigroup we can adjoin a zero element if it does not already have one, without changing its structure. We remark that in each semigroup 1 and 0 are unique.

DEFINITION 1. We say that a semigroup S is ordered if it is supplied with an order $<$ such that:

1. For a, b, c in S , $a < b \Rightarrow ca \leq cb$ and $ac \leq bc$.
2. $0 < 1$ (hence $0 = 0c \leq 1c = c$ for all c in S)

If the order is total S is called totally ordered.

DEFINITION 2. An hypervaluation on a ring R is a function from R onto a totally ordered semigroup S , satisfying the following conditions: For all a, b in R .

1. $|a| = 0 \Leftrightarrow a = 0$
2. $|a| = |-a|$
3. $|ab| = |a| |b|$
4. $|a+b| \leq \text{Max} \{ |a|, |b| \}$

Notice that if the semigroup S does not have any zero divisors then the ring R does not have any either. For if $a, b \in R$ with $a \neq 0, b \neq 0$, and $ab = 0$, then $0 = |0| = |ab| = |a| |b|$, while $|a| \neq 0$ and $|b| \neq 0$. But this is impossible since S is assumed with no zero divisors. Also we easily see that a cancellative semigroup has no zero divisors, however the converse is not true in general as we shall see in what follows.

2. CONSTRUCTION OF A NON-CANCELLATIVE, TOTALLY ORDERED SEMIGROUP WITHOUT ZERO DIVISORS

We begin with an arbitrary given totally ordered semigroup $(S_1, \cdot, >) = \{0_1, a, b, \dots\}$ where 0_1 its absorbent (zero) element. Consider now the set $S_2 = S_1 \cup \{0_2\}$ that we get if we adjoin a new element 0_2 to the set S_1 . Define an operation $*$ on S_2 by setting $a*b = a \cdot b$ if a, b are in S_1 , and $0_2*a = a*0_2 = 0_2$ for all a in S_2 . In particular $0_2*0_1 = 0_1*0_2 = 0_2$. We observe then that:

- $(S_2, *)$ is a semigroup and 0_2 is its zero (absorbent) element (self evident)
- $(S_2, *)$ has no zero divisors. Indeed if $a, b \in S_2$ with $a \neq 0_2$ $b \neq 0_2$ then $a, b \in S_1$ and by definition $a*b = ab \in S_1$ and hence $ab \neq 0_2$.
- $(S_2, *)$ is non cancellative. Indeed we can take a, b in S_1 with $a \neq b$. Then $0_1*a = 0_1a = 0_1 = 0_1b = 0_1 * b$. Thus $0_1*a = 0_1*b$ but $a \neq b$.
- Finally we define a total order \leq on S_2 by setting $a \leq 0_2$ for all a in S_1 , and for a, b , in S_1 , $a \leq b \iff a > b$. It is obvious that this is well defined, and that $(S_2, *, \leq)$ becomes a totally ordered semigroup.

3. A PROPOSITION

Notation: In what follows, we will denote by S_1 an arbitrary given totally ordered semigroup, and by S_2 the corresponding totally ordered non cancellative semigroup without zero divisors, obtained from S_1 , by adjoining a new absorbent element 0_2 , as it was done in section 2.

PROPOSITION: Let I be a two sided ideal of a (not necessarily commutative) integral domain R . If R/I can be hypervaluated by S_1 , then R can be hypervaluated by S_2 .

PROOF: Let $|\dots|: R/I \rightarrow S_1 = \{0_1, a, b, \dots\}$ be a valuation from R/I onto S_1 . We define the function $\|\cdot\|: R \rightarrow S_2$ by setting: For a in R , $\|a\| = 0_2$ if $a \in I$ and $\|a\| = |a+I|$ if $a \notin I$. This implies that if a is in I , with $a \neq 0$, then $\|a\| = 0_1$.

We see that $\|\cdot\|$ thus defined, satisfies the four properties of hypervaluation: Indeed properties (1) and (2) of definition 2 are obviously satisfied. That (3) holds for all a, b in R is immediate if at least one of them equals to zero. So we may assume $a \notin I, b \notin I$, and thus $ab \notin I$ since R is an integral domain. Then $\|ab\| = |ab+I| = |(a+I)(b+I)| = |a+I| |b+I| = \|a\| \cdot \|b\|$.

Finally (4) is also satisfied. For if $a, b \in R$, if at least one of them equals to zero the proof is immediate. Suppose now $a, b \notin I$. Then we could have $a+b \in I$ or $a+b \notin I$. If $a+b \in I$ then $\|a+b\| = 0_2 \leq \|a\|, \|b\| \leq \max\{|a+I|, |b+I|\}$. If $a+b \notin I$ then $\|a+b\| = |a+b+I| = |(a+I)+(b+I)| \leq \max\{|a+I|, |b+I|\} = \max\{\|a\|, \|b\|\}$. This completes the proof.

4. COFFI'S THEOREM FOR HYPERVALUABILITY OF A RING

DEFINITION 3. Let R be a ring. For any element a in R we call the set of left annihilators of a to be the set $\{x \in R \mid x \cdot a = 0\}$ and we denote this set by $A_L(a)$. In an analogous way we define the set of right annihilators of a denoted by $A_R(a)$.

THEOREM 1: (Coffi - Nikestia): Let R be a ring with a unit element 1 . R can be hypervaluated by a totally ordered semigroup S if and only if it satisfies the following conditional:

1. For all $a \in R$, $A_L(a) = A_R(a)$ and we denote this set by $A(a)$.
2. For all $a, b \in R$, $A(a \cdot b) = A(b \cdot a)$
3. The class $C = \{A(a), A \in R\}$ is totally ordered by inclusion.

In particular, R possesses an hypervaluation $|\dots|$ such that $|a| \rightarrow A(a)$ is a one-to-one correspondence between S and C .

We remark that Coffi in his construction supposes the semigroup to be commutative. The ring R is not supposed to be necessarily commutative, but with an identity element 1. The details can be found in Coffi [1]. The idea is the following: For each a in R , its "value" $|a|$ is $A(a)$. So $|\dots|: R \rightarrow C=S$. Moreover S is totally ordered by the total order defined as follows: For a, b in R $|a| \leq |b|$ if $A(a) \supseteq A(b)$.

5. OUR MAIN THEOREM

THEOREM: There exists a totally ordered non cancellative semigroup S without zero divisors, and a ring R that can be hypervaluated by this semigroup.

PROOF: We choose an integral domain R (not necessarily commutative) such that R/I (for some two-sided ideal I of R) be a ring satisfying the conditions of Coffi's theorem. Then by Coffi's theorem R/I can be hypervaluated by a totally ordered semigroup S_1 .

From S_1 we obtain a totally ordered, non cancellative semigroup S_2 without zero divisors, as we did in section 2.

By our Proposition 1, we can hypervaluate R by S_2 that has the desired properties. This concludes the proof of our theorem.

6. A CONCRETE EXAMPLE

We provide in this paragraph a concrete example of a Ring hypervaluated by a totally ordered, non cancellative semigroup S_2 without zero divisors.

Let Z be the ring of integers and (16) the ideal in Z generated by 16. It suffices to show that the ring $Z/(16)$ satisfies the conditions of Coffi's theorem and thus can be hypervaluated by a totally ordered semigroup S_1 . Because then, by our Proposition of section 3, Z can be hypervaluated by a semigroup S_2 , having the desired properties. Indeed since $Z/(16)$ is commutative, conditions 1 and 2 are obviously satisfied. Now if $a, b, x \in Z$ and $\bar{a}, \bar{b}, \bar{x} \in Z/(16)$ their corresponding equivalence classes, \bar{x} is then an annihilator of \bar{a} in $Z/(16)$ if and only if $x \cdot a \in (16)$ i.e. iff 16 divides xa . Let (a, b) denote the least common multiple of two elements a, b in Z .

- Thus:
- If $(a, 16) = 1$ then $A(\bar{a}) = \{\bar{16}\} = \{\bar{0}\}$
 - If $(a, 16) = 2$ then $A(\bar{a}) = \{\bar{8}, \bar{16}\}$
 - If $(a, 16) = 4$ then $A(\bar{a}) = \{\bar{4}, \bar{8}, \bar{12}, \bar{16}\}$
 - If $(a, 16) = 8$ then $A(\bar{a}) = \{\bar{2}, \bar{4}, \bar{6}, \bar{8}, \bar{10}, \bar{12}, \bar{14}, \bar{16}\}$

If in general $(a, 16) = (b, 16)$ then $A(\bar{a}) = A(\bar{b})$, if $(a, 16) > (b, 16)$ then $A(\bar{a}) \supset A(\bar{b})$.

Condition 3 of Coffi's theorem is also therefore satisfied.
